

VENTEC™

## Natural materials that breathe

Non-synthetic materials are a natural choice that's why they are as comfortable against your skin whether you are sitting or dressing. And once your chair's natural materials have served their purpose, nature doesn't mind taking them back.

Throughout nature, breathing is important. The same is true of chairs. A chair that breathes will stay fresh longer, keeping you fresh too. Inspired by nature itself, RH has developed Ventec™, a natural fabric with a unique capacity to transport moisture and heat away from the body. Fully breathable Ventec™ is used in the back and seat of the RH Ambio work chair . And, sitting more comfortably, aids performance and productivity - completely naturally.

Ventec™ from RH features a unique combination of natural rubber, horsehair and wool – materials borrowed entirely from nature. Studies conducted by the independent research institute Swerea show that Ventec™ is 25 percent more effective at transporting heat and 15 percent better at transporting moisture away from the body than conventional foam filling materials. Plus, Ventec™ is biodegradable, which is good news for the environment. Read more at [www.rhchairs.co.uk](http://www.rhchairs.co.uk)
